Jin a £ r £ b

as series up

to l=4 term?

check case of

b=500 and a=>0

symmetry about  $\hat{z}$  so  $\Phi$  only depends on r and  $\Theta$  general solution:  $\Phi(r,\Theta) = E(A_{\ell}r^{\ell} + B_{\ell}r^{\ell-1}) P_{\ell}(\sigma S \Theta)$ 

continuity condition says  $\bar{\Phi}(a,\theta) = \bar{\Phi}(b,\theta)$ 

B('s: 更(a,0)= そv for 0ともとサ/2 のfor T/2くせくTT

亚(b, t) = { O for 0<b<T/>
12<b<T

So  $\Phi(a,\theta) = \{A_{\ell}a^{\ell} + B_{\ell}a^{-\ell-1}, P_{\ell}(os\theta)\}$ 

 $\underline{\Psi}(b,\theta) = \underbrace{Z}_{e} A_{e} b^{e} + B_{e} b^{-l-1} P_{e} \cos\theta$  (2)

we know  $\int_{1}^{1} P_{m}(x) P_{n}(x) dx = \frac{2}{2n+1} \int_{2n+1}^{2n} f_{mn}$ from orthogonality of Legendre polynomials

so (an get rid of sum by multiply our P's by a Legendre polynomial and then integrating both sides of (1) and (2)

Let 
$$x = cos\theta$$

$$\int_{-1}^{1} \Phi(a, x) P_{\ell}(x) dx = V \int_{0}^{1} P_{\ell}(x) dx$$

$$= \int_{-1}^{1} [A_{\ell} a^{\ell} + B_{\ell} a^{-\ell-1}] P_{\ell}^{2}(x) dx$$

$$\int_{-1}^{1} \Phi(b, x) P_{\ell}(x) dx = V \int_{-1}^{0} P_{\ell}(x) dx$$

$$= \int_{-1}^{1} [A_{\ell} b^{\ell} + B_{\ell} b^{-\ell-1}] P_{\ell}^{2}(x) dx$$
We know  $\int_{-1}^{1} P_{\ell}^{2}(x) dx = \frac{2}{2\ell+1}$ 

$$= \int_{-1}^{1} [A_{\ell} b^{\ell} + B_{\ell} b^{-\ell-1}] P_{\ell}^{2}(x) dx$$

$$= \int_{-1}^{1} [A_{\ell} b^{\ell} + B_{\ell} b^{-\ell-1}] P_{\ell}^{2}(x) dx$$

$$= \int_{-1}^{1} [A_{\ell} b^{\ell} + B_{\ell} b^{-\ell-1}] P_{\ell}^{2}(x) dx$$

$$= \int_{-1}^{1} [A_{\ell} b^{\ell} + B_{\ell} b^{-\ell-1}] P_{\ell}^{2}(x) dx$$

$$= \int_{-1}^{1} [A_{\ell} b^{\ell} + B_{\ell} b^{-\ell-1}] P_{\ell}^{2}(x) dx$$

$$= \int_{-1}^{1} [A_{\ell} b^{\ell} + B_{\ell} b^{-\ell-1}] P_{\ell}^{2}(x) dx$$

$$= \int_{-1}^{1} [A_{\ell} b^{\ell} + B_{\ell} b^{-\ell-1}] P_{\ell}^{2}(x) dx$$

$$= \int_{-1}^{1} [A_{\ell} b^{\ell} + B_{\ell} b^{-\ell-1}] P_{\ell}^{2}(x) dx$$

$$= \int_{-1}^{1} [A_{\ell} b^{\ell} + B_{\ell} b^{-\ell-1}] P_{\ell}^{2}(x) dx$$

$$= \int_{-1}^{1} [A_{\ell} b^{\ell} + B_{\ell} b^{-\ell-1}] P_{\ell}^{2}(x) dx$$

$$= \int_{-1}^{1} [A_{\ell} b^{\ell} + B_{\ell} b^{-\ell-1}] P_{\ell}^{2}(x) dx$$

$$= \int_{-1}^{1} [A_{\ell} b^{\ell} + B_{\ell} b^{-\ell-1}] P_{\ell}^{2}(x) dx$$

$$= \int_{-1}^{1} [A_{\ell} b^{\ell} + B_{\ell} b^{-\ell-1}] P_{\ell}^{2}(x) dx$$

$$= \int_{-1}^{1} [A_{\ell} b^{\ell} + B_{\ell} b^{-\ell-1}] P_{\ell}^{2}(x) dx$$

$$= \int_{-1}^{1} [A_{\ell} b^{\ell} + B_{\ell} b^{-\ell-1}] P_{\ell}^{2}(x) dx$$

$$= \int_{-1}^{1} [A_{\ell} b^{\ell} + B_{\ell} b^{-\ell-1}] P_{\ell}^{2}(x) dx$$

$$= \int_{-1}^{1} [A_{\ell} b^{\ell} + B_{\ell} b^{-\ell-1}] P_{\ell}^{2}(x) dx$$

$$= \int_{-1}^{1} [A_{\ell} b^{\ell} + B_{\ell} b^{-\ell-1}] P_{\ell}^{2}(x) dx$$

$$= \int_{-1}^{1} [A_{\ell} b^{\ell} + B_{\ell} b^{-\ell-1}] P_{\ell}^{2}(x) dx$$

so comparing coefficients of right hand sides:

So comparing coefficients of

$$A_{L}a^{L} + B_{L}a^{-L-1} = \frac{2l+1}{2} \vee \int_{0}^{1} P_{L}(x) dx$$
 $A_{L}b^{L} + B_{L}b^{-L-1} = \frac{2l+1}{2} \vee \int_{-1}^{0} P_{L}(x) dx$ 
 $= \frac{2l+1}{2} \vee \int_{0}^{1} P_{L}(x) dx$ 

= 
$$\frac{2l+1}{2} \vee (-1)^{l} \int_{0}^{l} P_{l}(x) dx$$

separating out Az and Bz:

Separativity out the unit of
$$A_{\ell} = \frac{2\ell+1}{2(a^{2\ell+1}-b^{2\ell+1})} V[a^{\ell}-b^{\ell+1}(-1)^{\ell}] \int_{0}^{\ell} P_{\ell}(x) dx \quad (3)$$

$$B_{\ell} = (\alpha^{\ell+1}) \frac{2\ell+1}{2} \vee \int_{0}^{1} P_{\ell}(x) dx - A_{\ell} \alpha^{2\ell+1}$$
 (4)

we want l=0,1,2,3,4 terms so find  $A_{\ell}$ 's first and plug into Be equation

we know for even I that so'p, (x) dx = + s'pe(x) dx so only odd terms (1>0) will survive and only need Po, .P., P3  $\int_0^1 P_0(x) dx = 1$  $B_3 = -\frac{7Va^4 - a^2}{160} - \left[ -\frac{7V(a^4 + b^4)}{16(a^2 - b^2)} a^2 \right]$  $\int_0^1 P_1(x) dx = \frac{1}{2}$ 5, b3 (x) qx = - 1/8  $= -\frac{7}{10} Va^{4}b^{4} \left[ \frac{b^{3} + a^{3}}{b^{2} - a^{3}} \right]$ plugging into (3): A = V/2  $A_1 = \frac{3V(a^2 - b^2(-1)^1)}{3(a^3 - b^3)} \cdot \frac{1}{2} = \frac{3V(a^2 + b^2)}{4(a^3 - b^3)}$  $\frac{1}{2/a^3-b^3}$  $A_3 = \frac{7}{2(a^7 - b^7)} \cdot (-\frac{1}{8}) = -\frac{7V(a^4 + b^4)}{16(a^7 - b^7)}$ now plug Ao, A, and Az into (4):

 $\beta_0 = \frac{a}{3}V - \frac{\sqrt{a}}{3}a = 0$ 

$$B_{1} = a^{2} \left(\frac{3}{2}\right) \vee \left(\frac{1}{2}\right) - a^{2} \left[\frac{3 \vee (a^{2} + b^{2})}{4 (a^{3} - b^{3})}\right]$$

$$= \frac{3}{4} \vee a^{2} - \frac{3}{4} \vee a^{3} \frac{(a^{2} + b^{2})}{a^{3} - b^{3}} = \frac{3}{4} \vee a^{2} b^{2} \left[\frac{b + a}{b^{3} - a^{3}}\right]$$

$$B_{3} = a^{4} \left(\frac{7}{2}\right) \vee \left(-\frac{1}{8}\right) - a^{7} \left[-\frac{7 \vee (a^{4} + b^{4})}{16 (a^{7} - b^{7})}\right]$$

$$= -\frac{7}{16} \vee a^{4} b^{4} \left[\frac{b^{3} + a^{3}}{b^{7} - a^{7}}\right]$$

but  $\Phi(r,\theta)$  needs to go to 0 as  $r\to\infty$ so this means only B terms survive (neg exp) besides Ao term

besides Ao term
$$\Phi(r,\theta) = A_0 P_0(\chi) + \frac{B_1}{V^2} P_1(\chi) + \frac{B_3}{r_4} P_3(\chi)$$

$$= \frac{VP_{0}(x) + \frac{3}{4} \frac{Va^{2}b^{2} \left[\frac{b+a}{b^{3}-a^{3}}\right] P_{1}(x) - \frac{7}{16} \frac{Va^{4}b^{4} \left[\frac{b^{3}+a^{3}}{b^{4}-a^{7}}\right] P_{3}(x)}{r^{4} \left[\frac{b^{3}+a^{3}}{b^{4}-a^{7}}\right] P_{3}(x)}$$

$$= \frac{1}{2} \left[ P_0(x) + \frac{3a^2b^2}{2r^2} \left( \frac{b+a}{b^3-a^3} \right) P_1(x) - \frac{7}{8} \frac{a^4b^4}{r^4} \left[ \frac{b^3+a^3}{b^2-a^2} \right] P_3(x) \right]$$

so at 
$$b \rightarrow \infty$$
  
 $\pm (r, \theta) = \frac{1}{2} \left[ P_0(x) + \frac{3}{2} a_1^2 P_1(x) - \frac{7}{2} a_1^4 P_3(x) \right]$ 

for 
$$\alpha \rightarrow 0$$
  
 $\underline{\psi}(r,\theta) = \frac{1}{2}[P_{0}(x)]$
